## CRITICAL VALUE POLICY- MARSHFIELD REGION

### SCOPE

This policy is applicable to all laboratories within Marshfield Labs Laboratory Service Line.

### PURPOSE

Critical values may imply a life-threatening situation for the patient and must be brought to the immediate attention of the physician and/or the patient care staff responsible for the patient. Prompt notification of potentially life-threatening test results is important to ensure appropriate care is administered. Critical (panic) values are established for a normal population, though in some instances may not be considered “critical” when related to particular disease states. Interpretation of test results and determining if a result is critical to a particular disease state is the responsibility of the requesting physician. The purpose of this policy is to provide staff with the list of test values identified as potentially life-threatening.

Significant values have been identified for certain Microbiology and Molecular Pathology test results within the Marshfield Clinic Health System. These results are abnormal or unexpected, but not immediately life-threatening. However, they require prompt communication with caregivers to prevent potential patient harm. Timely review by physicians or patient care staff is essential, as delays may lead to serious adverse outcomes.

### POLICY STATEMENT

- All critical values are promptly reported to the ordering provider or designee following the applicable notification procedure(s).
  - For lab setting refer to the *Critical Value Notification Procedure* for notification procedure.
  - For point of care setting (POC) refer to *Communication of Critical Results and Critical Tests Policy-Acute Care* or *Communication of Critical Results Policy-Ambulatory Care*
- Approved designees include:
  - Nurse responsible for the patient
  - Provider’s Medical Assistant (M.A.) or Health Service Coordinator
  - Nurse in the same department or unit
  - Health Unit Coordinator (HUC) on same unit, only if RN is not available.
  - Technologist in the laboratory from which the specimen was referred (Outreach only)
  - Patient (only for Direct Access Testing (DAT))
- Notification must include the following:
  - Patient’s full name
  - Medical record number (or accession number)
  - Date and time of specimen collection
  - Test name
  - Patient test result and reference range.
  - Any additional pertinent information (i.e. hemolysis, lipemia, etc.)

Copyright© Sanford

- Notification and verification of read back must be electronically documented in the lab or Transfusion Service information system(s). Read back documentation must include the identity (first and last name) of the person called.
  - Point of Care Setting: *The identity of the testing individual and person notified need not be recorded when the individual performing the test is the same person who treats the patient. In this circumstance, the medical record must include the critical result, date, and time.*
- If a critical result is discovered on an assay that was not ordered, notify the provider. Explain that the critical value was discovered on a test that was not ordered. Inform the provider an add-on order will need to be placed if the provider would like the results in the medical record (the provider is not required to order the test). Document the results and the call, including who was notified and when as a result note comment on the ordered test.

Refer to [Attachment I: Critical and Significant Value List](#) subsections for critical and significant values and conditions for notification.

- *Conditions are not applicable for Point of Care test results.*
